## Quick Overview . . .

- What are Function Points?
- When are Function Points useful in the product life cycle (hint: from planning to retirement)?
- What is IFPUG?
- Five function point types and their values
- An example, of course
- Function Points and estimating

# How Function Point Analysis Helps . . .

- As an ISO standard (ISO/IEC 20926 SOFTWARE ENGINEERING) Function Point Analysis (FPA) provides a basis for repeatable and consistent sizing
- Supported by IFPUG and its membership community, FPA remains viable as new technologies and approaches to software development evolve (case studies, books, conferences, workshops, certifications, and, the "standard")
- Functional sizing is not influenced by programming language, in-house or COTS development
- Functional sizing is not impacted by development approach: outsourcing, in-sourcing, iterative, incremental, scrum, or agility
- Functional sizing can be approximated at the first sighting of customer requirements, estimated with a design, and counted upon delivery
- FPA can be used to track requirements volatility over the life of a project (FPs added, changed, deleted) to size requirements creep

## About IFPUG (http://www.ifpug.org/). . .

IFPUG is the International Function Point Users Group

IFPUG is a volunteer non-profit organization

IFPUG maintains the standard(s)

- Counting Practices Manual 4.3.1 (2010)
- Certification Process (CFPS / CFPP) and automated exam in several languages

Provides conferences, workshops, white papers

Supported by numerous service providers for training, consulting, counting

Has a voting membership across six continents

Has a fulltime "home office"

Offers individual and organizational memberships

# Why Projects Stumble

# Standish Chaos Report Challenged projects suffer from:

- 1. Lack of User Input
- 2. Incomplete Requirements and Specifications
- 3. Changing Requirements and Specifications
- 4. Lack of Executive Support
- 5. Technology Incompetence (DTRA, XML?)
- 6. Lack of Resources
- 7. Unrealistic Expectations
- 8. Unclear Objectives
- 9. Unrealistic Time Frames
- 10. New Technology

## Impaired (cancelled) projects suffer from:

- 1. Incomplete Requirements
- 2. Lack of User Involvement
- 3. Lack of Resources
- 4. Unrealistic Expectations
- 5. Lack of Executive Support
- 6. Changing Requirements and Specifications
- 7. Lack of Planning
- 8. Didn't Need it Any Longer
- 9. Lack of IT Management
- 10. Technology Illiteracy

# IEEE Spectrum, Robert N. Charette, September, 2005 Why Software Fails

- 1. Unrealistic or unarticulated project goals
- 2. Inaccurate estimates of needed resources
- 3. Badly defined system requirements
- 4. Poor reporting of the project's status
- 5. Unmanaged risk
- 6. Poor communication among customer, developers, and users
- 7. Use of immature technology
- 8. Inability to handle the project's complexity
- 9. Sloppy development practices
- 10. Poor project management

### Function Points come from two sources:

#### **Data Functions**

- Internal Logical Files (ILFs)
- External Interface Files (EIFs)

#### **Transactional Functions**

- External Input (Els)
- External Output (EOs)
- External Inquiry (EQs)

Ref: Function Point Counting Practices Manual 4.3.1; January, 2010

# Definitions of Function Point Data Functions (two types):

**External Interface File (EIF) –** user recognizable group of logically related data or control information, which is referenced by the application being measured, but which is maintained within the boundary of another application (Joe's abbreviated description – a data structure which is used to access or retrieve data updated by the system)

Internal Logical File (ILF) – user recognizable group of logically related data or control information maintained within the boundary of the application being measured (Joe's abbreviated description – a data structure which is used to hold data updated by the system)

Ref: Function Point Counting Practices Manual 4.3.1; January, 2010

# Definitions of Functional Components are of three types:

"CRUD" - create, read, update, delete

**External Input (EI) –** elementary process that processes data or control information sent from outside the boundary (Joe's abbreviated description – CUD)

**External Inquiry (EQ) –** elementary process that sends data or control information outside the boundary (Joe's abbreviated description – R)

**External Output (EO)** – elementary process that sends data or control information outside the boundary and includes additional processing logic beyond that of an External Inquiry (Joe's abbreviated description – C or U or D, R)

Ref: Function Point Counting Practices Manual 4.3.1; January, 2010

# Take a Crack at these Apps (using previous definitions)

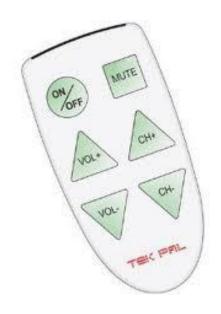

# 1<sup>st</sup> Crack (but need a systems engineer!)

Application	ILF	EIF	EI	EO	EQ
On/ Off			1		
Mute			1		
Volume +	1		1		
Volume -			1		
CH +	1		1		
CH -			1		

# 1st Crack (but need a systems engineer to validate!)

	LOW	AVG.	HIGH
ILF	7	10	15
EIF	5	7	10
EI	3	4	6
EO	4	5	7
EQ	3	4	6

Sum of the functional size – (6 (low) Els x 3) + (2 (low ILFs) x 7)  
= 
$$(6 \times 3) + (2 \times 7)$$
  
=  $18 + 14$   
=  $32$ 

# We have a number (32) - so what?

### Consider metrics (assuming you collect them) for:

- Productivity: Function Points per Person Month
- Cost: \$ per Function Point
- Defect Removal Efficiency: Defects per Function Point
- "Velocity:" Delivery time per Function Point

 Sustainability: # of Function Points supported per person (operations & support)

# Examples of the diverse usage of FPA

(from Capers Jones)

Products	Circa 2009	Circa 2018	Daily usage	
	Available	Available	(hours)	
Home computer	1,000,000	2,000,000	2.5	
Automobile	300,000	750,000	3.0	
Smart appliances	100,000	750,000	24.0	
Televisions	25,000	125,000	4.0	
Home alarms	5,000	15,000	24.0	
Home music	7,500	20,000	2.5	
I-Phone	20,000	30,000	3.0	
Digital camera	2,000	5,000	0.5	
Electronic books	10,000	20,000	2.5	
Social networks	25,000	75,000	2.5	
TOTAL	1,494,500	3,790,000	20.5	

Using Function Point Metrics For Software Economic Studies, Capers Jones, January 2010

# (now that we know what function points are) Estimating and measuring throughout the product lifecycle

1. Approximate the size as soon as requirements are discovered (not merely when baselined, accepted, or approved). We now have an idea of the size of the product.

More approximations are preferred – statistical cone of uncertainty.

**Hurricane Katrina** 

Provides a likely path (outcome) and margin of error

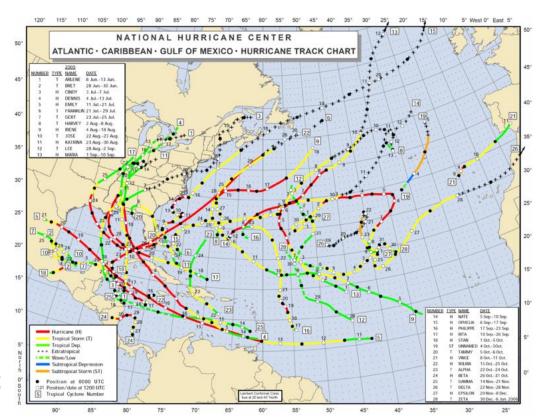

# Use multiple models (QDE) and historic data

Approximate based on historical performance data (this assumes that such data is collected, stored, and analyzed).

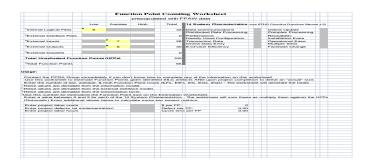

#### See also CMMI-DEV® v1.3:

- Measurement and Analysis, SG2
- Organizational Process Performance, SG1

# Estimating and measuring throughout the product lifecycle (continued)

2. Estimate when size is understood and resources are made available to the project

3. Count, record, and analyze the size, cost, and schedule of the project. (can be used for future estimations)

# Closing thoughts . . .

Others working on the use of Function Point-like measures for systems engineering and INCOSE include Ricardo Valerdi, University of Arizona and Mauricio Aguiar, President of TI Metricas, Brazil. <a href="http://www.lit.inpe.br/seday">http://www.lit.inpe.br/seday</a>

Automated Function Point counting—it's coming

Use Function Points to get closer to the right size of the product; improve estimates . . .

Elicitation with the customer is a discussion you will have anyhow (the spreadsheet is merely a way to record it)

Do you have organizational measures on which to predict cost and hours / schedule once you have a size?

Do you have multiple ways of estimating that might show you the overlapping space and raise confidence?

Do you contribute your measures to an organizational repository for your benefit and that of others?

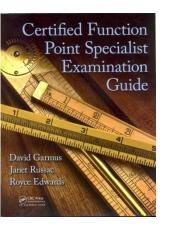

Defect re-work is already in your organizational productivity data; what happens if you eliminate much of that re-work?

# **CMMI** Topics

- History / motive of model(s): SW-CMM, HW-CMM, SE-CMM, P-CMM,
   CMMI-DEV, SVC, ACQ
- Maturity and Capability Levels Staged and Continuous
- Process areas
- GPs / GGs / SPs / SGs
- Institutionalization the leveraging of \_\_\_\_\_\_, \_\_\_\_\_, and \_\_\_\_\_\_
- · SCAMPIS
- Misconceptions: waterfall-based, suitable for large corporations only, used by defense industry & government

# Briefly about Joe . . .

Joe Schofield is the President of the International Function Point Users Group. He retired from Sandia National Laboratories as a Distinguished Member of the Technical Staff after a 31-year career. During twelve of those years he served as the SEPG Chair for an organization of about 400 personnel which was awarded a SW-CMM® Level 3. He continued as the migration lead to CMMI® Level 4 until his departure. Joe has facilitated over 100 teams in the areas of software specification, team building and organizational planning by using lean six sigma and business process reengineering.

Joe has taught graduate courses since 1990 and is a licensed girl's mid-school basketball coach. He has over 80 published papers, conference presentations and keynotes—including contributions to the books IT Measurement, Certified Function Point Specialist Exam Guide, The Economics of Software Quality, and a software measurement book. He is a SEI-authorized Instructor for the Introduction to the CMMI® and two other SEI courses, Certified Software Quality Analyst, Certified Function Point Specialist, and a Certified Software Measurement Specialist.

Joe is a frequent presenter in the Software Best Practices Webinar Series sponsored by Computer Aid, Inc. Joe completed his Master's degree in MIS at the University of Arizona in 1980. By "others" he is known as a husband, father, and grandfather.
