

The Use of Function Points for Software Estimation and Measurement

Joe Schofield,
Sandia National Laboratories
Albuquerque, N. M.

Sandia is a multiprogram laboratory operated by Sandia Corporation, a Lockheed Martin Company,
for the United States Department of Energy under contract DE-AC04-94AL85000.

Five Function Point-related Topics

- Quick hits on Function Points – primer
- Now that you know everything, an example
- Using measurements throughout the life of the project
- Impact on process maturity (CMMI®)
- Unique measurement opportunity?

Function Point Facts

The most widely used standard software size metric throughout industry is Function Points.

Capers Jones of Software Productivity Research refers to the use of lines of code for measurement as professional malpractice.

Function Points are now an ISO/IEC standard. (20926 date: 11/03)

Function Points were first developed in 1979.

Statistical analysis has demonstrated the integrity of Function Point counting by trained counters.

Function Point counting incorporates the following principles:

- **count all the functionality provided to the customer**
- **count only the functionality provided to the customer**
- **counting must be independent of technology**

A CFPS is a Certified Function Point Specialist (3-part exam) administered by IFPUG.

Function Point Facts (cont'd)

According to Capers Jones, Function Point usage reduces the risk of:

- project termination,
- litigation for breach of contract,
- unstable requirements,
- poor quality, and
- cost and schedule overruns

Function Points are calculated by counting screens, reports, queries, and files / database tables / objects. These are known in FP parlance as:

- External Inputs,
- External Outputs,
- External Inquiries,
- Internal Logical Files, and
- External Logical Files.

According to Capers Jones projects with function point analysis:

- have less scope creep
- have about 15% lower cost overruns
- have about 25% less schedule slips
- save between \$25 and \$75 per function point

A Function Point Example

This screen contains no data that is maintained in data structures (partial assumption). Its purpose is for navigational. Navigational interfaces without persistent data have no Function Points.

A Function Point Example (cont'd)

The screenshot shows the Southwest Airlines website interface. At the top, there's a navigation bar with 'SOUTHWEST.COM' and links for 'Book Travel', 'Special Offers', 'Travel Tools', and 'Rapid Rewards'. Below this is a secondary bar with buttons for 'AIR', 'CAR', 'HOTEL', 'CRUISE', 'VACATION PACKAGES', and 'TRAVEL SUMMARY'. A progress bar indicates the booking steps: 'PLAN TRIP' (highlighted in red), 'SELECT FLIGHT', 'PRICE', 'PURCHASE', and 'BOOKED'. Below the progress bar, there's a section for 'Standard Reservation' with links for 'Rapid Rewards Awards Reservations' and 'Rapid Rewards Companion Pass Reservations'. The main section is titled 'Where are you traveling?' and includes a link to a map of cities served. It features three dropdown menus for 'Depart:', 'Arrive:', and 'Return:'. The 'Depart:' and 'Arrive:' menus list five cities: Albany, NY - ALB; Albuquerque, NM - ABQ; Amarillo, TX - AMA; Austin, TX - AUS; and Baltimore, MD - BWI. The 'Return:' menu has 'None' selected, with other options being 'Depart City/Round Trip', 'Albany, NY - ALB', 'Albuquerque, NM - ABQ', and 'Amarillo, TX - AMA'.

Purchase Summary

Item	Description	Due Now
Air	Total amount, including tax, that will be charged to your credit card.	\$ 212.80

Before completing your purchase, please verify your [Passenger Names](#) are correct. Changes to Passenger Names after selecting the "I Want To Purchase This Air Travel" button could result in a fare increase.

[I Want To Purchase This Air Travel](#)

[Start Over](#)

Need [help booking travel](#)?

This screen as shown (apparently) queries several data structures (credit card type, state, country) and creates list of cities served by SWA. Three ILFs and EQs are evident.

Apply travel funds “navigates” to another query.

A Rapid Rewards query is also triggered upon name entry; potentially another ILF and certainly an EQ.

Eventually when clicking “I Want to Purchase this Air Travel” and EI will stored this transaction in a new ILF and also trigger itinerary distribution which as EQs.

A Function Point Example – (cont'd)

Select Rental Car...

Will you need a rental car? ☐ Yes ☒ No			
Company	Vehicle Type	Rental Car Codes/Numbers	
-- Shop All Rapid Rewards Partners -- -- Shop All Cars -- Alamo Budget Dollar Hertz	Economy Compact Mid-size Full-size Premium Luxury	Rate Code	Corporate ID/Rate
		- None -	- None -
		Promo Code	Frequent Renter Num
		- None -	- None -
* You may select more than one company by holding down the Ctrl, Shift or Command (Apple) keys.		* See our Vehicle Types page for car descriptions.	
		* Codes and Numbers are accepted only for those Rental Car Companies which are listed in the drop down boxes.	

Select Hotel...

Will you need a hotel? ☐ Yes ☒ No			
Company	Where would you like to stay?	Distance From City/Airport/Point of Interest	
-- Shop All Rapid Rewards Partners -- -- Shop All Hotels -- Cambria Suites Candlewood Suites Clarion Comfort Inn Comfort Suites Courtyard by Marriott	☒ Stay Near Downtown of Arrival City ☐ Stay Near Arrival Airport ☐ Other City Optional Point of Interest (Example: Grand Canyon)	0 - 5 Miles 	All Directions
		Number of Adults	Number of Children
		1	0
		Negotiated Corporate Rate Code	
* You may select more than one company by holding down the Ctrl, Shift or Command (Apple) keys.		* Negotiated Corporate Rate Code is assigned by a hotel for a particular company.	

A similar series of event occurs for rental cars and hotels; I'll spare you.

Using a Data Model to Estimate Function Points

An estimate of Function Point size can be developed from a simple data model. First remove disqualified files as ILFs, and then multiple by . . .

A Measurement Life Cycle

	<u>FPAW</u>	<u>QDE</u>	<u>Estimation Worksheet</u>	<u>FP Counting Worksheet</u>
Purpose	Rough size value in Function Points	Rough size, cost, and FTE values	Firm size and resource estimate	Tally and document Function Point counts
Triggers are	Proposal, CRs, Enhancements	Proposal in lieu of detailed project planning data	Data Model, External Interfaces Definition	Product Release for actual Data Model & External Interfaces Definition for estimates
When in Lifecycle	During early plan and throughout lifecycle when requirements change	Planning	Design	Design through Operations
Risk Impact to Project	Higher risk due to uncertainty about product	Higher risk due to uncertainty about product	Minimal risk as functionality is solidified	No risk as product is finished - values are used to improve future estimates
Typically used by	Trained project leader	Trained project leader	Trained project leader	Trained FP counter in conjunction with project team

FPAW – Function Point Approximation Worksheet

QDE – Quick ‘n Dirty Estimate

Approximate during Proposal Discussions

Function Point Approximation Worksheet									
Contact: Questions concerning this worksheet may be directed to Joe Schofield									
Purpose: This approximation (approximate when you aren't quite ready to estimate) worksheet supplements the SILC estimation worksheet by providing estimate for the product requirements using Function Points. No knowledge of Function Point counting is required!									
The values generated by this worksheet are used in conjunction with the approximation worksheet as a second dimension to approximating product size									
When to use: As part of planning / replanning and when the project team has an understanding on the types of objects / entities that the product will support and the functions that are likely to be needed in the product.									
How to use: (the derived values in this spreadsheet use medium complexity values, IFPUG 4.2 2004)									
Enter in the Logical Files column the logical data groupings (call these entities or objects) from the customer's perspective that will be maintained (added, modified, or deleted).									
For each logical data set, identify the likely functions to be performed on the logical data groupings. Enter a "y" under the column for Create, Update, Delete, or Read.									
Enter in the Logical Files column the logical data groupings (call these entities or objects) from the customer's perspective that will be interfaced from or to the system for editing or reporting.									
For each logical data set directly above, enter a "y" under the column for Read.									
What you'll get: An approximated Function Point count that will treat your input as medium complexity Function Point types. This number will NOT likely change in the Approximation Worksheet since your requirements understanding is still likely yet to evolve.									
Limitations: This spreadsheet is designed to work for up to 80 data sets; though it could be easily changed to accommodate more.									
6	2	4	1	3					
Data Functions					Your Approximated Function Point Count				
Logical Files	Create	Update	Delete	Read					100
Hotels				y					
Car Rentals		y	y						
Trips	y	y		y					
Travelers		y							
Reservations	y								
Airlines									

Approximate

Can also be used throughout the lifecycle to measure requirements size change!

The *QDE* provides a ballpark range when you know as few as one of three project variables

QDE Worksheet					
Note: the resulting numbers derived from this worksheet will place your project at a medium or high level of risk until detailed estimates are derived using the SILC Estimating Process.					
Enter Labor Dollars:	200000.00				
Estimated Function Point Size	432.90				
Estimated Cycle Time needed	25.46	person months			
Enter Person Months	25.00				
Estimated Function Point Size	425.00				
Estimated Labor Dollars	196350.00				
Enter Function Points	433.00				
Estimated Labor Dollars needed	200046.00				
Estimated Cycle Time needed	25.47	Person months			

Approximate

Estimates are based on historic organizational performance

During planning, real resources and costs can be used to provide a range of expected results

ILF = 28 FPs

EIF = ~72 FPs

Subject to change as the project undergoes change!

Actual Function Point counts are performed based on delivered product

	Low	Average	High	Total	14 System Characteristics (use IFPUG Counting Practices Manual 4.1)			
¹ Internal Logical Files				0	Data Communications		Online Update	
					Distributed Data Processing		Complex Processing	
² External Interface Files				0	Performance		Reusability	
					Heavily Used Configuration		Interoperability	
³ External Inputs				0	Transaction Rate		User Ease	
					Online Data Entry		Multiple Sites	
³ External Outputs				0	End-User Efficiency		Facilitate Change	
³ External Inquiries				0				
Total Unadjusted Function Points (UFPs)				0				

Count Actuals

Actuals can be compared to estimates to determine variance, noting approved changes to baselines where applicable.

Usage:

Contact the SQA Group immediately if you don't know how to complete any of the information on this worksheet!

Use this worksheet to estimate Function Points given identified SILC artifacts AND upon project completion to derive an "actual" size.

Enter the number of low, average, & high Function Point types (ILFs, EIFs, EIs, EOs, EQs) - The worksheet will generate the totals

¹These values are derivable from the information model.

²These values are derivable from the external interface model.

³These values are derivable from the presentation layer.

⁴Use this number for estimating the Function Point size on the Estimation Worksheet.

Enter a value between 0 and 5 for each of the 14 System Characteristics - The worksheet will sum these as multiply them against the UFPs

(Optionally) Enter additional values below to calculate some key project metrics:

Enter project labor costs			\$ per FP:	#DIV/0!
Enter project defects (at implementation)			Defect per FP:	#DIV/0!
Enter project labor hours			Cycle time per FP	#DIV/0!

Actual Function Point counts are performed based on delivered product

Requirements Volatility	
Purpose: The purpose of this worksheet is to measure the degree of change in requirements since the previous count, taking into account new requirements and changes to existing requirements. Refer to the Metrics Glossary for clarification on measurement terms used in this worksheet.	
Process: Not later than the end of each activity (SILC phase) or iteration, use the current "Approximated Function Point Count" from the current FPAW (table) to determine change in size of the product. Enter your "Approximated Function Point Count" in the cell adjacent to "Previous FP Count" below. Make any additions to the FPAW for new functionality since the last update of the FPAW. Enter this value adjacent to "New count;" below. Determine if any of the pre-existing functions on the FPAW have changed since the last measurement. (The value for these can be determined by removing (deleting) that functionality in the FPAW, looking at the Count, re-entering a "Y", and taking the difference.) If the volatility exceeds the threshold established in the IPMP, correction action, including re-planning, should occur. Version control this spreadsheet for future reference.	
Previous FP count:	100
New count:	120
Changes to the existing functionality:	4
Requirements Volatility:	24%

Use Actuals to Manage!

The *cumulative* impact of requirements volatility is the target of threshold management.

Function Points can contribute to the following highlighted MA practices

Measurement and Analysis (ML2, Support)

... develop and sustain a measurement capability that is used to support management information needs.

SP 1.1 Establish Measurement Objectives

SP 1.2 Specify Measures

SP 1.3 Specify Data Collection and Storage Procedures

SP 1.4 Specify Analysis Procedures

SP 2.1 Collect Measurement Data

SP 2.2 Analyze Measurement Data

SP 2.3 Store Data and Results

SP 2.4 Communicate Results

Function Points can contribute to the following highlighted REQM practices

Requirements Management (ML2, Engineering)

. . . manage the requirements of the project's products and product components and to identify inconsistencies between those requirements and the project's plans and work products.

SP 1.1 Obtain an Understanding of Requirements

SP 1.2 Obtain Commitment to Requirements

SP 1.3 Manage Requirements Changes

SP 1.4 Maintain Bidirectional Traceability of Requirements

SP 1.5 Identify Inconsistencies Between Project Work and Requirements

Function Points can contribute to the following highlighted PP practices

Project Planning (ML2, Project Management)

. . . establish and maintain plans that define project activities.

GP 4.1 Establish Quantitative Objectives for the Process

GP 4.2 Stabilize Subprocess Performance

GP 5.1 Ensure Continuous Process Improvement

GP 5.2 Correct Root Cause of Problems

Advertised Objectives of this Session

Why Should I Care? What are Function Points?

What problem(s) am I solving with Function Points?

What are some useful Function Point metrics? (cost per Function Point, FPPPM, cycle time)

How can Function Points be used before I have a stable set of requirements?

How can Function Points enable me to better track project progress?

What threads through the CMMI exist for Function Points?

Are cost and schedule really the most likely constraints to impair project success?

And we do this because . . .

Measurements speak louder than opinions.

Function Points can be used for rational negotiation with customers and management (we call this insulation).

Unlike stock markets disclaimers, future performance can be predicted based on past performance given similar attributes.

Estimates can be made with higher levels of confidence than using new methods with each project.

You won't need to clean-up later and you won't need to be as charming! (see first comment above)
